Full Stack Developer (Fresher)

Role	Full Stack Developer
Experience	Entry-level; 0 - 1 year
Location	Erode, Tamil Nadu
Employment	Full time
Hiring	Fresher

About The Cloud Company

The Cloud Company is a modern software engineering company building digital products, enterprise platforms and AI-driven solutions for businesses. From web applications and scalable backend systems to intelligent AI experiences, we turn ambitious ideas into real-world solutions. We build reliable products that solve real business problems and keep delivering value as businesses grow. We are looking for the next generation of developers, curious people who care about what they build, to build it with us.

Role Summary

We're looking for an early-career full stack developer who can build across a web application: React and TypeScript on the front, Python or Node on the back, SQL underneath. Professional experience is not required; practical work from projects, internships, coursework or open-source contributions counts.

With guidance, you'll take well-defined tasks through building, testing and review, and grow towards owning small features. You must be ready to work across the whole stack; this is not a frontend-only role. We expect curiosity, sound fundamentals and steady learning, not a finished developer.

Tech Stack

Not every project uses all of this, and nobody arrives knowing the whole list. This is what's actually in use.

Frontend	React, Next.js, TanStack Start, TypeScript
Mobile	React Native
Backend	FastAPI, Django, Hono, Node.js, REST APIs
Databases	PostgreSQL, MS SQL Server, Redis
AI	LangChain, LangGraph, DeepEval, LLM APIs, RAG and vector search
Infrastructure	Docker, CI/CD pipelines, AWS or Azure

What You Will Do

- Build tasks within client platforms and internal tools across the frontend, backend and database, with guidance from seniors.
- Take well-defined tasks, break each into steps, ask questions early, and see each one through build, test and review without being chased.
- Choose the simplest approach that works, make small decisions inside your own task, and know when to ask your lead.
- Flag early when a task won't make its deadline or you are blocked, and know which of your own tasks is most urgent.
- Build responsive, accessible interfaces and the APIs and database changes behind them.
- Use AI tools in your daily work and check what they produce. With guidance, add AI features using LLM APIs, retrieval and evaluation, and verify the output.
- Use Git, take part in code review, and write code and documentation the next person can follow.
- Give clear written and spoken updates on your own tasks to the team, and, with a senior present, on client calls.
- Debug from evidence and apply testing and security basics while you build.

Required Skills

- No professional experience is required.
- Working knowledge of React and TypeScript: components, state, forms, validation and talking to APIs.
- Backend fundamentals in Python or Node, including REST APIs and authentication basics.
- SQL fundamentals: tables, relationships, CRUD operations, joins and basic schema design.
- HTML and modern CSS, responsive layout, accessibility basics and browser developer tools.
- Git fundamentals: branches, useful commits, pull requests and responding to review feedback.
- The habit of breaking a messy problem into pieces and debugging it methodically instead of guessing.
- Clear written English for updates, the habit of getting to the point first, a strong learning mindset, and sound judgement with LLM APIs and AI-assisted development tools.

Good to Have

- A deployed full-stack project, internship experience or a meaningful open-source contribution.
- Docker, CI/CD, or deploying an application to AWS or Azure.
- An AI project using LLM APIs, RAG, vector search, agents or prompt evaluation.
- React Native or Expo, automated testing, performance work or security basics.

Why Join Us

- You'll learn the whole system: frontend, backend, schema, deployment and client context.
- You'll work with experienced developers who review your code and help you grow from feedback.
- You'll contribute to real features used by real businesses, not practice work that gets thrown away.
- You'll learn to judge AI work by whether it helps, not by how the demo went.
