

Mistral Solutions

Software Role

Round 1:

Find the output questions

1. Pre-increment and Post-increment
2. Multiple increment/decrement in expressions more than one (++ or --)
3. Operator precedence and associativity
4. Arithmetic expressions with mixed operators
5. Short-circuit evaluation (&&, ||)
6. Conditional/Ternary operator (?:)
7. switch-case problems
8. break and continue inside loops
9. goto labels
10. basic pointer arithmetic, double pointers
11. Pointers with arrays
12. static variables
13. Local vs global variables how variable changes based on declaration
14. Size of structure and union

Round 2:

In Tech Interview 1, C basics like storage classes, static and dynamic memory allocation, and the difference between arrays and linked lists were asked. They also asked how much memory each data type can occupy, like integer – 4 bytes. They asked whether we can store 255 in a character variable and asked 2 programming questions: palindrome check for integers and swapping two numbers without arithmetic operations. They also asked to explain storage classes with example code and the default values for static, global, and auto variables.

When going for the interview, also be strong in bitwise operations like XOR, AND, OR, and NOT. For me, both tech rounds were online rounds. For some others, they were face-to-face rounds.

Round 3:

In Tech Interview 2, they asked me to write a program using a singly linked list. This was the main question for that round for me, along with some basic C questions.

Then there was the general HR round.

There was also another round after Round 1 and before Technical Interview 1. It was a programming round with basic C programs. Different questions were given to each person in this round.
