Digital Engineering – Job Descriptions

1. Power BI Developer

Job Summary

We are looking for a Power BI Developer to design, develop and maintain enterprise-grade business intelligence solutions. The role will work closely with business stakeholders, data engineers and application teams to translate business requirements into actionable dashboards and analytics.

Key Responsibilities

- Develop interactive dashboards, reports and data visualizations using Power BI.
- Build optimized semantic models, datasets and reporting solutions.
- Create complex DAX measures, calculated columns and time-intelligence calculations.
- Develop Power Query transformations and data cleansing workflows.
- Connect Power BI with SQL databases, cloud data platforms, APIs and other enterprise data sources.
- Work with stakeholders to understand reporting requirements and translate them into technical solutions.
- Optimize report performance, data models and refresh processes.
- Implement row-level security, workspace governance and deployment practices.
- Collaborate with data engineers to ensure data quality, availability and reliability.
- Document reports, data models, business logic and technical dependencies.

Required Skills & Experience

- Strong Power BI, DAX, Power Query and data modeling skills.
- Good knowledge of SQL and relational databases.
- Experience with star schema, dimensional modeling and performance optimization.
- Understanding of Power BI Service, workspaces, gateways, refresh schedules and security.
- Strong analytical and problem-solving skills.
- Good communication and stakeholder management skills.

Preferred / Good to Have

- Experience with Azure, Microsoft Fabric, Azure Synapse or Databricks.
- Experience integrating APIs and cloud data sources.
- Power BI certification is an advantage.

Core Competencies

- Strong problem-solving and analytical ability.
- Good communication and collaboration skills.
- Ability to work effectively in Agile/iterative delivery environments.
- Commitment to quality, documentation and continuous improvement.

2. Power Apps Developer

Job Summary

We are seeking a Power Apps Developer to build business applications using the Microsoft Power Platform. The role will focus on low-code/no-code application development, workflow automation, integrations and delivering user-friendly solutions that improve business productivity.

Key Responsibilities

- Design and develop Canvas Apps and Model-driven Apps using Microsoft Power Apps.
- Develop automated business workflows using Power Automate.
- Integrate Power Apps with SharePoint, Dataverse, SQL Server, APIs and other enterprise systems.
- Configure Dataverse tables, relationships, business rules, security roles and solutions.
- Work with business users to gather requirements and convert them into scalable applications.
- Develop reusable components and follow Power Platform development standards.
- Troubleshoot application, integration and workflow issues.
- Support deployment across development, test and production environments.
- Maintain technical documentation and application support procedures.
- Identify opportunities for process automation and digital transformation.

Required Skills & Experience

- Strong hands-on experience in Power Apps and Power Automate.
- Good knowledge of Dataverse, SharePoint and SQL.
- Understanding of REST APIs and system integrations.
- Knowledge of application security, environments and solution management.
- Strong requirement gathering and stakeholder communication skills.

Preferred / Good to Have

- Experience with Power BI and Microsoft 365.
- Exposure to Azure services and enterprise integration patterns.
- Microsoft Power Platform certification is an advantage.

Core Competencies

- Strong problem-solving and analytical ability.
- Good communication and collaboration skills.
- Ability to work effectively in Agile/iterative delivery environments.
- Commitment to quality, documentation and continuous improvement.

3. Data Engineer

Job Summary

We are looking for a Data Engineer to design, build and maintain scalable data pipelines and platforms. The role will work across data ingestion, transformation, orchestration, quality and cloud data engineering to enable reliable analytics and business intelligence.

Key Responsibilities

- Design and develop scalable ETL/ELT pipelines for structured and unstructured data.
- Build data ingestion and transformation workflows using cloud and on-premise technologies.
- Develop and optimize complex SQL queries, stored procedures and data transformations.
- Work with data warehouses, data lakes and lakehouse architectures.
- Implement data validation, quality checks, monitoring and error handling.
- Build batch and, where required, near-real-time data processing solutions.
- Collaborate with BI developers, data scientists, application teams and business stakeholders.
- Optimize pipeline performance, storage and compute utilization.
- Implement data security, access controls and governance standards.
- Document data pipelines, source-to-target mappings and technical architecture.

Required Skills & Experience

- Strong SQL and database fundamentals.
- Hands-on experience with ETL/ELT and data pipeline development.
- Experience with Python or another data engineering language.
- Good understanding of data warehousing and dimensional modeling.
- Experience with **Azure/AWS/GCP** data services or equivalent cloud platforms.
- Strong troubleshooting and analytical skills.

Preferred / Good to Have

- Experience with Azure Data Factory, Databricks, Synapse, Microsoft Fabric or equivalent tools.
- Experience with Spark, Kafka or other distributed data technologies.
- Cloud/data engineering certification is an advantage.

Core Competencies

- Strong problem-solving and analytical ability.
- Good communication and collaboration skills.
- Ability to work effectively in Agile/iterative delivery environments.
- Commitment to quality, documentation and continuous improvement.

4. Full Stack Developer

Job Summary

We are seeking a Full Stack Developer to design, develop and maintain modern web applications across frontend and backend layers. The ideal candidate should be comfortable working with APIs, databases, cloud platforms and modern software development practices.

Key Responsibilities

- Design and develop responsive, scalable web applications.
- Build frontend components using modern frameworks such as React, Angular or equivalent.
- Develop backend services and RESTful APIs using Node.js, .NET, Java or equivalent technologies.
- Design and optimize relational and/or NoSQL database solutions.
- Implement authentication, authorization, validation and secure coding practices.
- Integrate third-party APIs and enterprise systems.
- Write clean, maintainable and testable code.
- Perform unit testing, debugging and code reviews.
- Collaborate with UX, product, QA, DevOps and business teams.
- Participate in Agile ceremonies, technical design and production support.

Required Skills & Experience

- Strong experience in at least one modern frontend framework such as React or Angular.
- Strong backend development experience using Node.js, .NET, Java or equivalent.
- Good knowledge of REST APIs, JSON and web application architecture.
- Strong SQL/database fundamentals.
- Experience with Git and Agile development practices.
- Understanding of application security and performance optimization.

Preferred / Good to Have

- Experience with Azure/AWS/GCP.
- Exposure to Docker, Kubernetes and CI/CD.
- Experience with microservices architecture.

Core Competencies

- Strong problem-solving and analytical ability.
- Good communication and collaboration skills.
- Ability to work effectively in Agile/iterative delivery environments.
- Commitment to quality, documentation and continuous improvement.

5. Software Tester / QA Engineer

Job Summary

We are looking for a Software Tester / QA Engineer to ensure the quality, reliability and usability of software applications. The role will cover functional testing, regression testing, API testing, defect management and automation where applicable.

Key Responsibilities

- Analyze requirements and create comprehensive test scenarios and test cases.
- Execute functional, integration, system, regression and user acceptance testing.
- Identify, document, prioritize and track software defects.
- Perform API testing using tools such as Postman or equivalent.
- Validate data using SQL queries and database checks.
- Collaborate with developers, product owners and business stakeholders to resolve defects.
- Participate in test planning, estimation and release readiness activities.
- Maintain test documentation, traceability and test execution reports.
- Develop and maintain automated test scripts where applicable.
- Support production validation and root-cause analysis.

Required Skills & Experience

- Strong understanding of SDLC, STLC and software testing methodologies.
- Hands-on experience with functional and regression testing.
- Experience with defect management tools such as Jira or Azure DevOps.
- Good knowledge of API testing and SQL.
- Strong analytical, documentation and communication skills.

Preferred / Good to Have

- Experience with Selenium, Playwright, Cypress or similar automation tools.
- Experience with CI/CD pipelines and Agile/Scrum environments.
- ISTQB or equivalent certification is an advantage.

Core Competencies

- Strong problem-solving and analytical ability.
- Good communication and collaboration skills.
- Ability to work effectively in Agile/iterative delivery environments.
- Commitment to quality, documentation and continuous improvement.

6. DevOps Engineer

Job Summary

We are looking for a DevOps Engineer to automate software delivery, infrastructure provisioning and operational processes. The role will focus on CI/CD, cloud infrastructure, containerization, monitoring, security and reliability.

Key Responsibilities

- Design, implement and maintain CI/CD pipelines for application deployments.
- Automate build, test, deployment and release processes.
- Manage cloud infrastructure across Azure, AWS or equivalent platforms.
- Develop Infrastructure as Code using Terraform, ARM/Bicep, CloudFormation or equivalent tools.
- Build and manage Docker containers and Kubernetes environments where required.
- Implement monitoring, logging, alerting and operational dashboards.
- Work with development and QA teams to improve deployment quality and release velocity.
- Implement security controls, secrets management and DevSecOps practices.
- Troubleshoot infrastructure, deployment and production issues.
- Document architecture, deployment processes, runbooks and operational procedures.

Required Skills & Experience

- Strong hands-on experience with Azure, AWS or equivalent cloud platforms.
- Experience with CI/CD tools such as Azure DevOps, Jenkins, GitHub Actions or GitLab CI.
- Strong Linux and scripting skills using Bash, PowerShell or Python.
- Experience with Git and Infrastructure as Code.
- Hands-on experience with Docker and exposure to Kubernetes.
- Understanding of networking, security, monitoring and cloud operations.

Preferred / Good to Have

- Experience with Terraform and cloud-native architecture.
- Experience with Azure DevOps, AKS/EKS/ECS or equivalent.
- DevOps, Azure or AWS certification is an advantage.

Core Competencies

- Strong problem-solving and analytical ability.
- Good communication and collaboration skills.
- Ability to work effectively in Agile/iterative delivery environments.
- Commitment to quality, documentation and continuous improvement.
