

- 1) Use HTML5, CSS Flexbox, CSS Grid, and responsive design and create the below landing page

- 2) Build a Student Management System using React where users can add, edit, delete, search, and sort student records containing Name, Department, Year, and CGPA. Implement form validation and manage the application state using the useState hook while ensuring a clean, responsive, and user-friendly interface.
- 3) Build a Notes Management Application using React as the frontend and JSON Server as the mock backend. Users should be able to create, view, edit, delete, search, tag, favorite, and archive notes by integrating REST APIs (GET, POST, PUT, DELETE) while managing state using useState and useEffect. Bonus features include Markdown Preview and a Character Counter, with emphasis on clean component design, responsive UI, proper CRUD flow, and code quality.
- 4) Build a Weather Application using React that fetches real-time weather information from a public weather API (such as OpenWeatherMap or WeatherAPI) based on a user-entered city. Display details like temperature, weather condition, humidity, wind speed, and weather icon, while implementing loading states, error handling, and responsive UI using useState and useEffect for API integration.
- 5) Develop an Event Registration Portal using React that displays a list of upcoming events. Users should be able to view available events, register for an event, cancel their registration, and search events by title or date. The application should provide a clean, responsive interface and manage all state using React Hooks.

- Interviewers expect do you atleast heard and know basics about these technologies
Tanstack react query, twigs(Survey Sparrows Open source CSS lib), webpack, backend
express, postgresql, click house (Even if not used in your projects just outline that you
know)
- SQL queries, bullmq(messaging queue architecture)
- Know what every line of your task does and why ?
- DSA leetcode style
