

1) Given free running water, Measure exactly 2 liters of water if you have:

a) 4 and 5-liter bowls

b) 4 and 3-liter bowls

2) You have a full bucket containing 24 liters of liquid.

You also have three empty buckets: one of 5 liters, one of 11 liters, and one of 13 liters.

How could you divide the 24 liters of liquid into three equal parts, so that you have three buckets containing 8 liters each?

3) You have a balance scale with four weights. With these four weights you must balance any whole number load from 1kg all the way up to 40kg.

How much should each of the four weights weigh?

(You may place weights on both sides of the scale at the same time.)

4) Several people were asked to jump over a pencil that was kept on the floor, but none could do so. Why?

5) You have 5 jars of pills. Each pill weighs 10 gram, except for contaminated pills contained in one jar, where each pill weighs 9 gm. Given a scale, how could you tell which jar had the contaminated pills in just one measurement?

6) SEND +
